Tiny Health hiring team

Product Designer

I am applying for the Product Designer role at Tiny Health. Your product has to make complex science feel trustworthy enough that a family will act on it. That is the design work I want to do, and the work I have been doing.

At FamilySearch, beginners arrived hoping to feel a connection to their family and met a toolbox built for hobbyists. I led product design for 26 personalized discovery experiences. Each one started from a person already in the tree (a name, a birthday, or a record) and offered one next action instead of a search lesson. Retention rose 95% for members and 107% for other users versus the prior year. A Tiny Health report has the same job. The value is not 120,000 microbes on a page. It is an expert highlight and an action plan a parent can actually follow.

At Entrata I spent seven years on that same problem with production data, field research, and engineering partners. That included Homebody, a resident-facing mobile app that reached 4.4 out of 5 on iOS from more than 600 reviews in its first six months; setup systems that had to stay accurate without getting harder to use; and AI flows that turned long paperwork into an upload. For about a year I was Product Lead with an owned engineering team, taking work from research through ship. I care more about whether people come back and act than whether the interface looks finished.

I live in Orem, Utah, so the 9am to 6pm CST overlap window fits my day. I have not designed in DTC health. I have designed for families at scale, shipped consumer mobile, and sat with experts until the science, or the system, could be said in a sentence a real person would use.

I would welcome the chance to walk you through the work.

Sincerely,

Cody Duke
